STABLESAVE · DEMO DAY

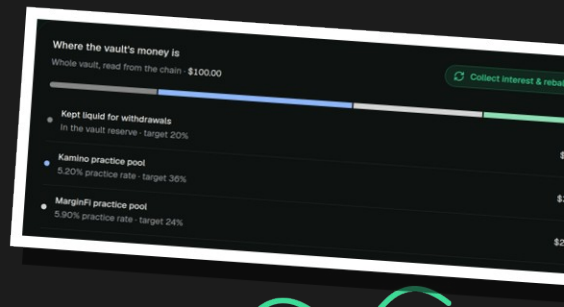

STABLE SAVE

STABLECOIN YIELD · SOLANA VAULT PROTOTYPE

Know the risk **before you chase the yield.**

Theo stablesaver-web.vercel.app

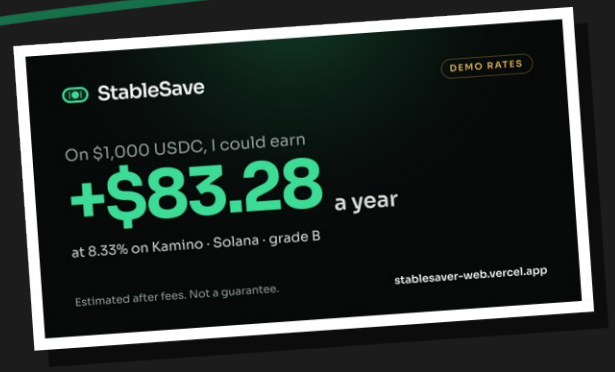

```
seeds = ["vault", mint,
         risk_profile]
LIQUIDITY_BUFFER_BPS = 2_000
```

StableSave

DEMO DAY

```
rebalance(vault, pool)
  // only toward the strategy
instant_limit: 2_000 / 24h
```

YIELD IS EASY TO FIND

Knowing **what you're taking on** is the hard part.

WHAT YOU SEE

A BIG APY

One number on a dashboard, usually the highest one.

CONCEPTUAL ILLUSTRATION

WHAT YOU TAKE ON

- **Scattered**: options sit across many protocols and networks
- **Higher isn't better**: a higher APY can mean more risk, not a better deal
- **Fees bite**: network fees can wipe out the return on a small deposit
- **Hard to compare**: security, liquidity, maturity and strategy complexity hide in docs
- **No framework**: beginners have no clear way to weigh any of it

AGENDA

01 **The comparison app**

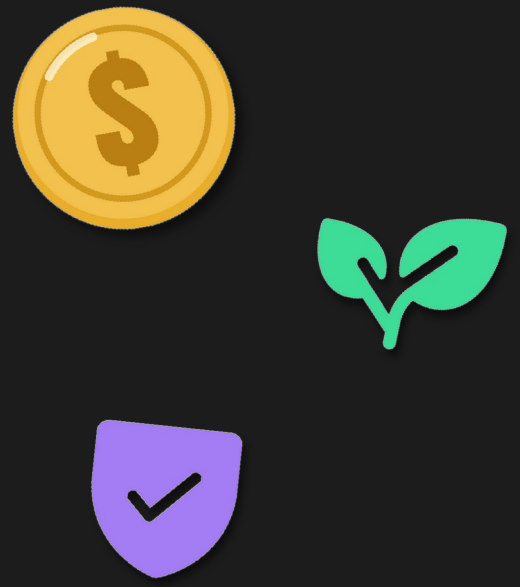

Compare yield, risk and what you keep after fees. Live today.

02 **The Solana vault**

A separate devnet prototype where the program enforces the rules.

03 **Demo and what's next**

What works today, what's missing, and the order I'll fix it in.

3 PARTS · 1 LIVE DEMO

CHAPTER 01

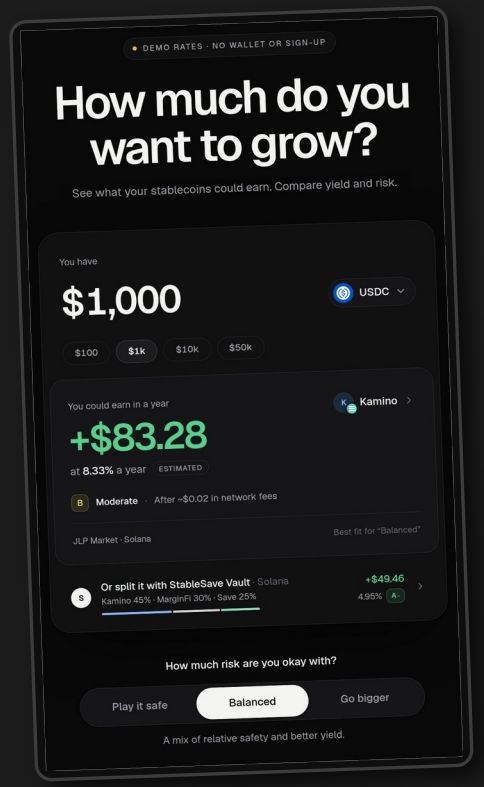

THE COMPARISON APP

Live today: compare yield, risk and **what you keep after fees**.

ONE PLACE TO COMPARE

Yield, risk and **what you keep after fees**, side by side.

REAL INTERFACE · DEMO DATA

HOW IT WORKS

01 **Enter a stablecoin amount**

02 **Pick a risk preference**

03 **Compare the options**

04 **Check the grade and its reasons**

05 **See earnings after fees**

06 **Continue to the official app**

NO WALLET OR SIGN-UP

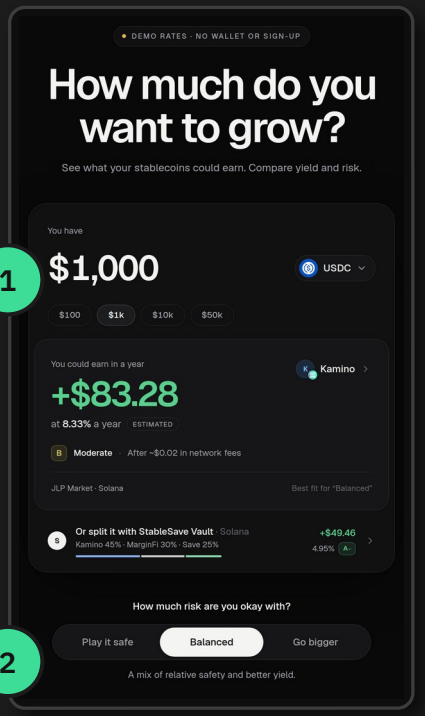

Comparing needs nothing but an amount.

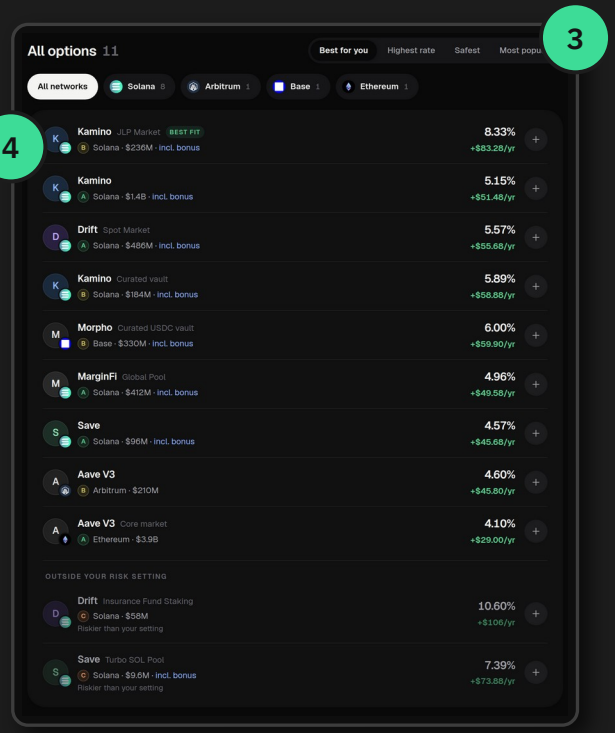

NEVER HOLDS YOUR FUNDS

You deposit from your own wallet, on the protocol's own app.

FROM BALANCE TO DECISION

In a few clicks: **ranked, graded and after fees**.

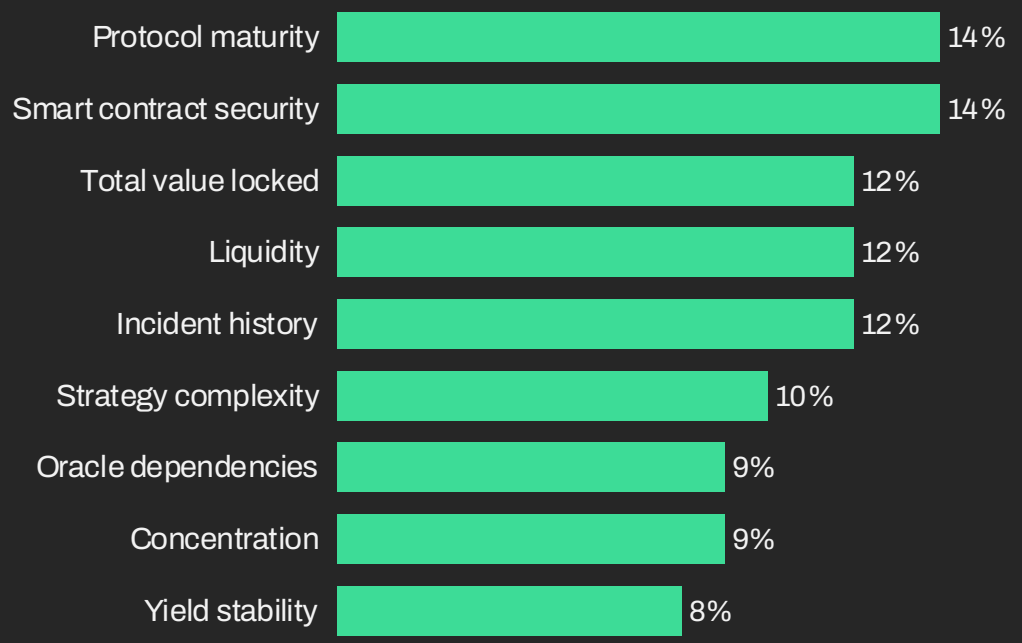

1. **Amount**
   $1,000 of USDC here
2. **Risk preference**
   Safe, Balanced or Bigger
3. **Ranked options**
   Best fit, rate or safety
4. **A–D grade**
   Next to network, deposits
5. **Rate history**
   30 or 90 days, daily
6. **After fees**
   What you'd keep a year

> **Worked example (demo data):** $1,000 USDC, Balanced, 8.33%: **about +$83 a year after fees**. Estimated, not promised.

HOW THE GRADE WORKS

A high APY should never tell the whole story: **the weakest factor always counts**.

NINE FACTORS · % OF THE SCORE

HOW THE SCORE IS BUILT

Score = 75% weighted average + 25% weakest factor

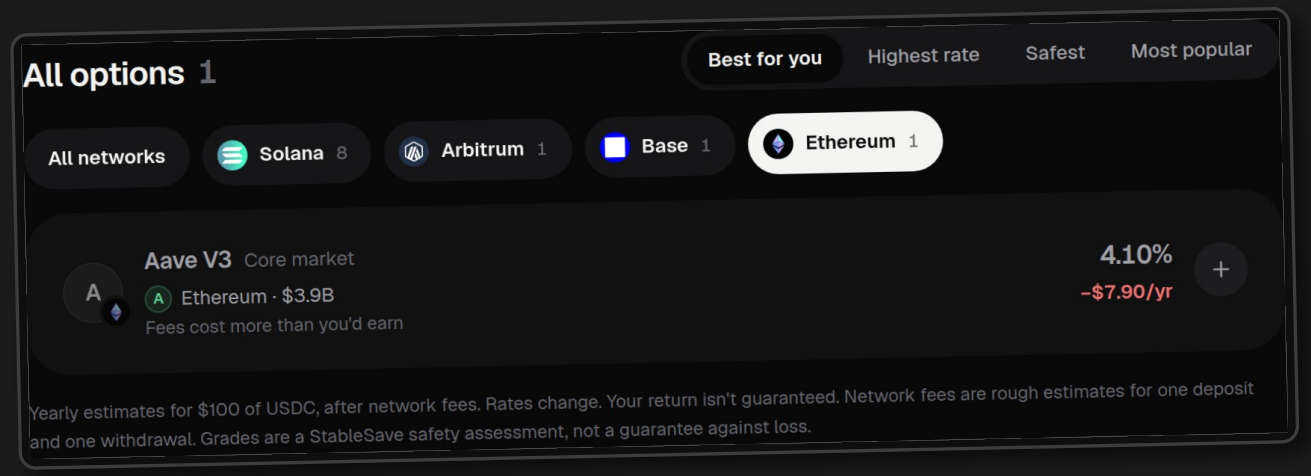

A	B	C	D
80+	65–79	50–64	<50

> **One weak factor (demo data):** Kamino JLP Market averages **81**, an A on its own. Concentration scores **37**, so the final score is **70: grade B**.

Hard caps can override the score (no public audits: at most C). Inputs the data doesn't cover are marked "Not verified" and scored cautiously, never guessed.

THE RETURN AFTER COSTS

On a small deposit, **fees can cost more than you earn**.

REAL INTERFACE · LOCAL BUILD, DEMO DATA · $100 OF USDC, ETHEREUM

ETHEREUM · $100 AT 4.10%

-$7.90

$4.10 interest – $12.00 network fees (est.)

SOLANA · $100 AT 4.10%

+$4.08

$4.10 interest – $0.02 network fees (est.)

> **Marked, not hidden:** $100 at 4.10% earns about $4.10 a year. Getting in and out of Ethereum is estimated at $12, so the app says **"Fees cost more than you'd earn."**

Illustrative: the same 4.10% with StableSave's per-network fee estimates for one deposit and one withdrawal. Estimates, not live gas prices.

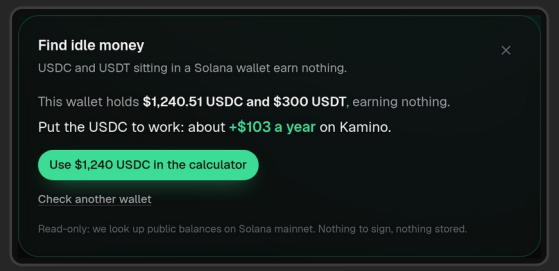

FOUR MORE QUESTIONS

Answered **before you deposit**.

FIND IDLE MONEY

Is money sitting idle in my wallet?

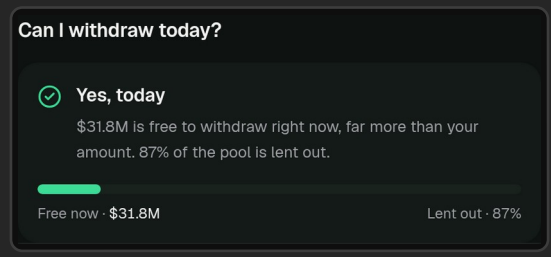

Paste any Solana address: read-only, and it fills the calculator.

CAN I WITHDRAW TODAY?

Can I get my money out today?

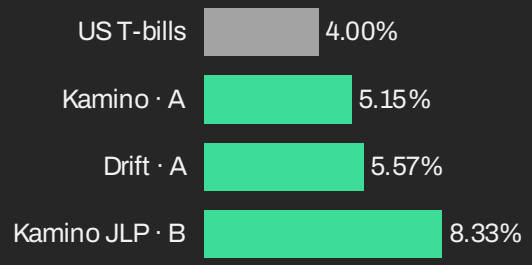

Cash free in the lending pool right now, versus your amount.

US T-BILL COMPARISON

Is it worth the crypto risk?

Every list starts with US Treasury bills, from the Treasury's own data.

SHARE MY ESTIMATE

Can I show someone?

One click copies a link that previews as this card.

REAL INTERFACE · LOCAL BUILD, DEMO DATA · THE WALLET SCAN USED A STAND-IN BALANCE

CHAPTER 02

THE SOLANA VAULT

A separate **devnet prototype**: the program enforces the rules.

THE VAULT PROGRAM

A separate Anchor prototype on devnet: **the program enforces the rules**.

User wallet
Signs every user action

deposit →
← withdraw

DEVNET · UNAUDITED

PRACTICE POOLS

StableSave Vault program

ANCHOR · DEVNET · 16 INSTRUCTIONS

PROGRAM-ENFORCED CHECKS

- Not paused
- Deposit ≥ minimum, under the vault cap
- Instant: 2,000 per wallet, 50,000 per vault / 24 h
- Bigger: request, wait 30 min, then execute
- Shares priced with a virtual offset

Admin: authority (settings, unpause, two-step handover) · guardian (pause only)

Vault PDA

`["vault", mint, risk_profile]`

Roles, limits, strategy, share totals

Reserve + practice pools

`["reserve"]` · `["pool", protocol]`

20% kept liquid; the rest split by strategy weight. Only the vault signs transfers out

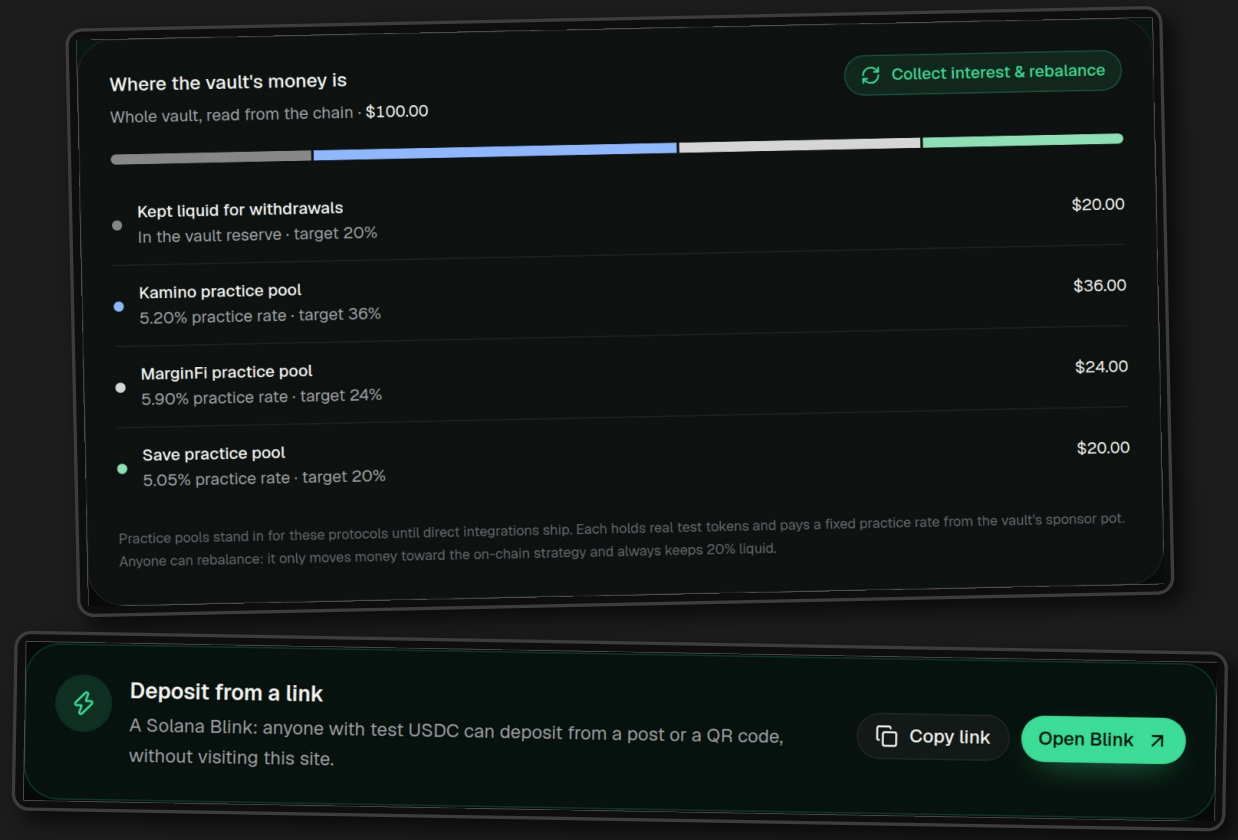

UserPosition PDA

`["position", vault, owner]`

One depositor's shares and pending withdrawal

EVERY DEPOSIT, SPLIT

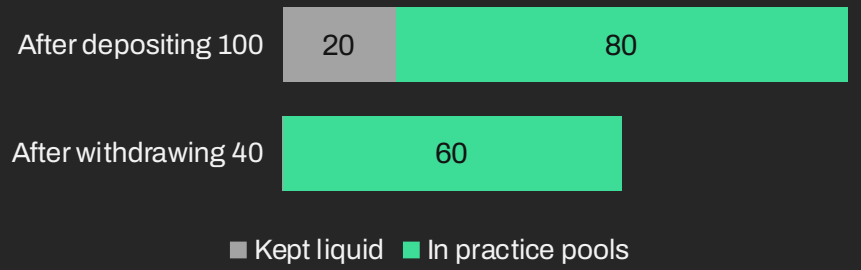

Into practice pools by strategy, **and a test proves it** on every change.

REAL INTERFACE · POOLS CARD SHOWS THE REHEARSAL'S SPLIT

CHECKED ON EVERY CHANGE

A real deposit and withdrawal on a local Solana validator, in GitHub Actions (test USDC)

Split by strategy
80 into three pools, 20 kept liquid

Pools top up withdrawals
The 20 short came back from the pools

The books match
Wallet 940 and pools 60, read on-chain

SECURITY IS TRADE-OFFS

Not a badge: **each control buys safety at a cost**.

On-chain checks
Pause, minimum and cap

Rejects bad deposits and exits

2,000 per wallet / 24 h
Instant withdrawal limit

Limits a stolen wallet

50,000 per vault / 24 h
Instant limit, all users

Slows a bank run

30-minute timelock
Above the instant limits

Time to react; big exits wait

Guardian pause
Only the authority unpauses

Fast stop; no escape hatch yet

Role-based admin
Two-step authority handover

One powerful key today

Virtual share offset
1,000 shares, 1 asset

Stops share-price inflation

Automated tests
14 unit + 10 integration

Plus a local deploy rehearsal

Not yet: audit · multisig authority · strategy-change delay · pause escape hatch · fuzz testing (everything above runs on devnet only)

CHAPTER 03

DEMO & WHAT'S NEXT

What works today, **what's missing**, and what I build next.

LET'S SEE IT WORK

Part A is **live**. Part B is a **devnet prototype**. Keep them separate.

A · LIVE

Comparison app

stablesaver-web.vercel.app

01 Find idle money in a wallet

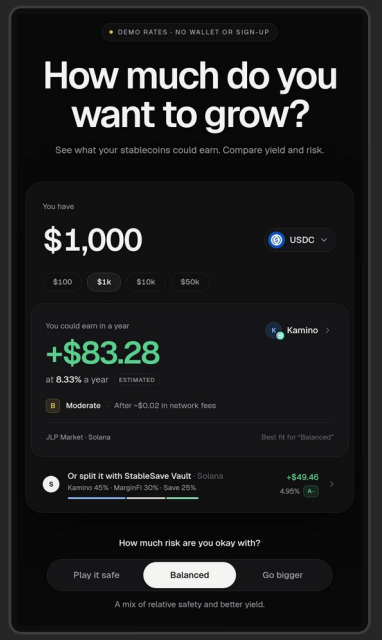

02 Switch Safe / Balanced / Bigger

03 Open an option: grade, withdraw

04 Compare with US T-bills

05 $100 + Ethereum: fees win

06 Share my estimate

B · DEVNET PROTOTYPE

Vault

Wallet on Solana devnet

01 Connect a devnet wallet

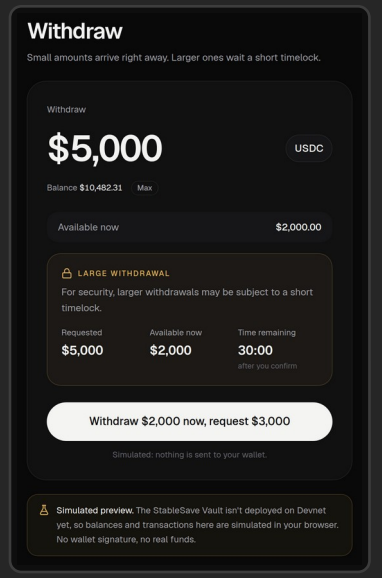

02 Deposit: split into pools

03 Where the money is

04 Collect interest, rebalance

05 Withdraw: pools top up

06 Deposit from a Blink

Devnet tokens have no value. Practice pools pay fixed practice rates, not market yield. Thumbnails: local build (demo data; vault in simulated preview).

LIVE, DEVNET, NOT YET

What's real, what's experimental, and **what's missing**.

LIVE

- Stablecoin opportunity comparison
- Risk grades and their reasons
- Fee-adjusted earnings estimates
- Withdraw-today check, T-bill row
- Idle-money scan, share cards

DEVNET PROTOTYPE

- Anchor vault program
- Deposits, shares, limits, timelock
- Split into practice pools on-chain
- Deposit Blink (Solana Action)
- Pause and authority controls

NOT YET IMPLEMENTED

- CPI into Kamino, MarginFi, Drift and Save
- Market yield through the vault
- Production security assurances

ALSO WORTH KNOWING

- One data source
- Fixed network-fee estimates
- Weights not back-tested
- Ranks on today's APY, not 30-day avg
- Bridge costs and risk not modelled
- Admin and upgrade-key risk

WHAT COMES NEXT

Safety first, then **the feature that makes the vault real**.

01

PHASE 1

Safety and correctness

- Escape hatch if a vault stays paused
- close_position to refund rent
- Fuzz the share math and limits

02

PHASE 2

Better recommendations

- Rank on the 30-day average APY
- Flag options that need funds moved between networks
- Back-test grades against past exploits

03

PHASE 3

Vault integration

- Swap a practice pool for one real Kamino strategy
- Tested against the real Kamino program
- Same rebalance and on-chain balances

04

PHASE 4

Admin and expansion

- Multisig authority
- Delay on strategy changes
- Alerts, read-only portfolio, more tokens

PLANNED WORK

None of this is built yet. Safety first, then the feature that makes the vault real.

THANK YOU!

Make stablecoin yield easier to understand **before making it easier to chase.**

SCAN TO TRY IT · STABLESAVER-WEB.VERCEL.APP

Feedback welcome on risk scoring, vault security, and which integration to build next.
