STABLESAVE · DEMO DAY

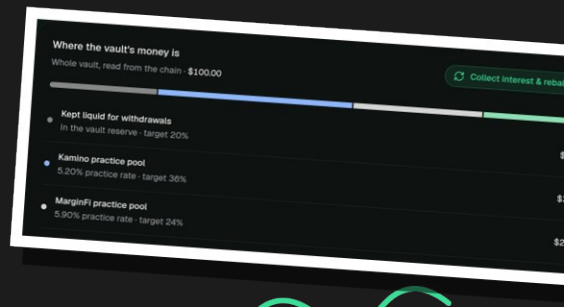

STABLE SAVE

STABLECOIN YIELD · SOLANA VAULT PROTOTYPE

Know the risk **before you chase the yield.**

Theo stablesaver-web.vercel.app

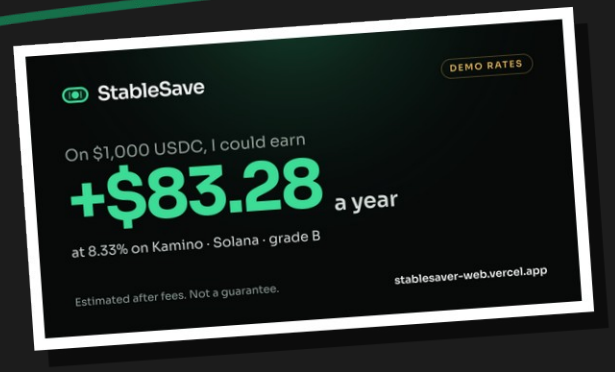

```
seeds = ["vault", mint,
         risk_profile]
LIQUIDITY_BUFFER_BPS = 2_000
```

StableSave

DEMO DAY

```
rebalance(vault, pool)
  // only toward the strategy
instant_limit: 2_000 / 24h
```

YIELD IS EASY TO FIND

Knowing **what you're taking on** is the hard part.

WHAT YOU SEE

A BIG APY

One number on a dashboard, usually the highest one.

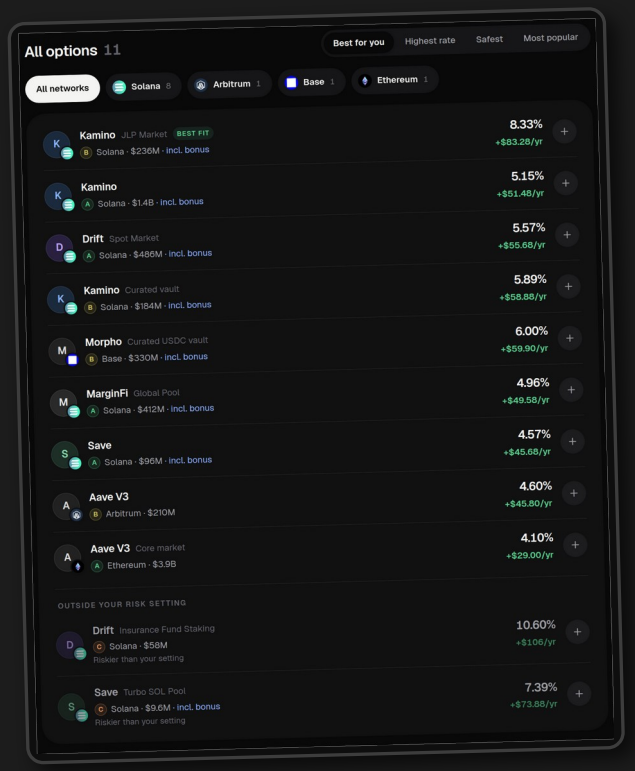

CONCEPTUAL ILLUSTRATION

WHAT YOU TAKE ON

- **Scattered**: options sit across many protocols and networks
- **Higher isn't better**: a higher APY often just means more risk
- **Fees bite**: network fees can wipe out the return on a small deposit

RATE, RISK, REAL RETURN

Every option shows the rate, **an A–D risk grade** and **what you keep after fees**.

REAL INTERFACE · LOCAL BUILD, DEMO DATA

A–D

RISK GRADE

Nine factors, and **the weakest one always counts**.

-$7.90

AFTER FEES · $100 ON ETHEREUM

Fees cost more than you'd earn, and the app says so.

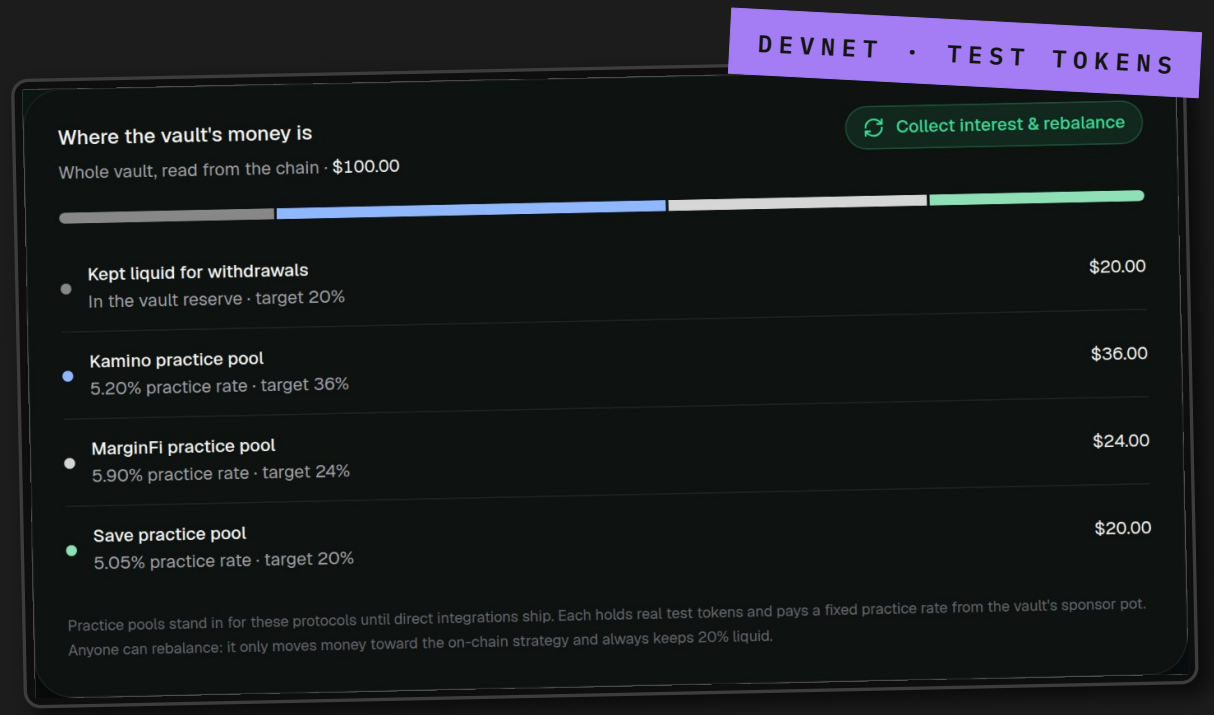

$0

HELD BY STABLESAVE

No sign-up to compare. **You deposit on the protocol's own app.**

THE SOLANA VAULT

A separate devnet prototype: **the program itself enforces the rules**.

REAL INTERFACE · THE SPLIT FROM THE CI REHEARSAL

ENFORCED ON-CHAIN

- **Split on deposit**: 20% kept liquid, the rest across practice pools by strategy
- **Withdrawal limits**: 2,000 a wallet a day at once; bigger exits wait 30 minutes
- **Safety switch**: a guardian can pause; only the authority unpauses
- **Deposit from a link**: the same deposit as a Solana Blink

Not yet: market yield (practice pools pay fixed practice rates) · an audit · a multisig

LET'S SEE IT WORK

Part A is **live**. Part B is a **devnet prototype**. Keep them separate.

A · LIVE · 1½ MIN

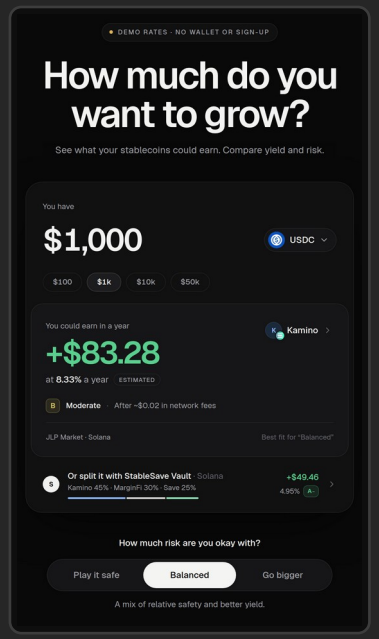

Comparison app

stablesaver-web.vercel.app

01 Type 1,000, then switch risk levels

02 Open the top option: its grade, and can I withdraw today?

03 Find idle money in a pasted wallet

B · DEVNET · 1½ MIN

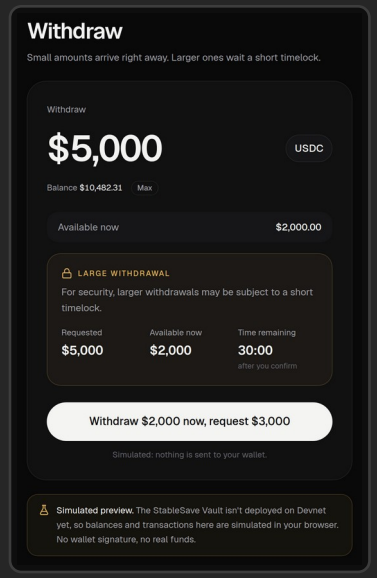

Vault

Wallet on Solana devnet

01 Deposit 100 test USDC

02 See the split: 20% liquid, the rest in pools

03 If there's time: deposit again from the Blink

Devnet tokens have no value. Practice pools pay fixed practice rates, not market yield. Thumbnails: local build (demo data; vault in simulated preview).

THANK YOU!

Make stablecoin yield easier to understand **before making it easier to chase.**

SCAN TO TRY IT · STABLESAVER-WEB.VERCEL.APP

Next: a real Kamino strategy in the vault, then an audit and a multisig.
